                                          <em>Brackets is a different type of editor.
                                          One notable difference is that this editor is written in JavaScript, HTML and CSS.
                                          This means that most of you using Brackets have the skills necessary to modify and extend the editor.
